

1. An IT (Information Technology) system comprising:  
issuing and managing means for issuing and managing an RFID  
(Radio Frequency ID) having a unified data format;  
an S-label on which the issued RFID is recorded;  
reading means for reading data including said RFID recorded  
on said S-label;  
authenticating means for authenticating said RFID read by  
said reading means; and  
service providing means for providing various kinds of  
services to an owner of said S-label based on data read by said  
reading means when authentication by said authenticating means  
achieves success.

3. The IT system according to claim 1, wherein said reading means transmits data read from said S-label to said transmitting means through a USB (Universal Serial Bus) interface.

5. The IT system according to claim 1, wherein said S-label includes:

an RFID storage portion for storing said RFID;  
a user storage portion for storing data inherent to each S-label; and  
an electric wave transmission portion for transmitting data stored in said RFID storage portion and said user storage portion

by wireless.

6. The IT system according to claim 1, wherein said reading means is a scanner having a card size.

7. The IT system according to claim 1, wherein said S-label is lent with or without charge for a predetermined period.

8. An IT system comprising:

issuing and managing means for issuing and managing an RFID having a unified data format with respect to each of commercial goods;

an S-label on which the issued RFID is recorded;

reading means for reading said S-label attached to each of commercial goods; and

information acquiring means for acquiring, from said issuing and managing means, information of commercial goods associated with said RFID read by said reading means.

9. An IT system comprising:

issuing and managing means for issuing and managing an RFID having a unified data format with respect to each of commercial goods;

an S-label on which the issued RFID is recorded;

reading means for reading data including said RFID recorded on said S-label;

a database recording therein information of commercial goods having said issued RFID; and

a store and a physical distribution center for making reference to said database,

said store and said physical distribution center respectively including said reading means to make reference to said database based on data of said S-label read by said reading means.

10. An IT system comprising:

issuing and managing means for issuing and managing an RFID

shipment status providing means for providing, to a customer, a shipment status of commercial goods ordered by the customer in question based on information managed by said issuing and managing means, when said customer makes inquiries about the shipment status of said commercial good.

first inventory status comprehending means for comprehending an inventory status based on a result of detection by said arrival status detecting means and said shipment status detecting means.

14. An IT system comprising:

- issuing and managing means for issuing and managing an RFID having a unified data format with respect to each of commercial goods;
- a database recording therein information of the commercial goods having the issued RFID;
- an S-label on which said RFID is recorded;
- reading means for reading data including said RFID recorded on said S-label; and
- retrieving means for looking up in said database based on a result of reading said S-label attached to each of commercial

goods by said reading means to acquire information of a corresponding commercial goods.
